

Open Data NY–Potential Research Questions

NYS Healthy Neighborhoods Program

Potential Research Questions:

1. Use data for a particular community as a baseline measure for new housing interventions or policies in the target area.
2. Use data for a particular community to demonstrate the potential for short-term improvement after the intervention. *(Note: This is not a true pre-post comparison. Paired data is required to assess statistical change because homes with the condition at the revisit may or may not have had the condition at the initial visit.)*

Additional research questions will be posted when dwelling-level data is available.
