

Benefits of Medicaid Potentially Preventable Emergency Visit Rates by County and Zip Code Datasets

The release of these data will allow researchers to analyze the rate of emergency visits that might have been prevented with proper inpatient or outpatient care by county or zip code. This could help in the planning of patient care projects by identifying geographical locations and disease conditions that need improvement.

The rates presented in these datasets will allow researchers the ability to analyze trends over time on both a statewide and geographic (county and zip code) basis for the Medicaid population.
